Often certain nodes in the network are randomly switched off, from some or all the layers of a neural network. Hence, in every iteration, we get a new network and the resulting network (obtained at the end of training) is a combination of all of them. This also helps in addressing the problem of overfitting.

### Neural Networks and Deep Learning | SpringerLink

Few ideas have enjoyed as large an impact on deep learning as convolution. For any problem involving pixels or spatial representations, common intuition holds that convolutional neural networks may be appropriate. In this paper we show a striking counterexample to this intuition via the seemingly trivial coordinate transform problem, which simply requires learning a mapping between coordinates ...
